

# Modal Logic

# Propositional logic may be defined in a Hilbert style fashion

Propositional logic is a set  $H$  defined as smallest set  $X$  of formulas verifying the following properties:

1. if  $A, B, C$  are formulas then  $X$  contains the formulas (called axioms)

**P1**  $A \rightarrow (B \rightarrow A)$

**P2**  $(A \rightarrow (B \rightarrow C)) \rightarrow ((A \rightarrow B) \rightarrow (A \rightarrow C))$

**P3**  $((\neg B \rightarrow \neg A) \rightarrow ((\neg B \rightarrow A) \rightarrow B))$

$L$  is closed w.r.t. the following operation

**MP** if  $A \in X$  and  $A \rightarrow B \in X$  then  $B \in X$  (modus ponens)

We write  $\vdash_H A$  to denote that  $A \in H$

If  $\Omega$  is a finite set of formulas we write  $\Omega \vdash_H A$  to denote that  $\vdash_H \bigwedge \Omega \rightarrow A$

If  $\Omega$  is an infinite set of formulas we write  $\Omega \vdash_H A$  to denote that there is a finite subset  $\Omega_0$  of  $\Omega$  s.t.  $\Omega_0 \vdash_H A$ .

## language of modal logic

alphabet:

(i) proposition symbols :  $p_0, p_1, p_2, \dots,$

(ii) connectives :  $\rightarrow, \perp$

(iii) modal operator  $\square$

(iv) auxiliary symbols :  $(, )$ .

$$AT = \{p_0, p_1, p_2, \dots, \} \cup \{\perp\}$$

The set WFF of (modal) formulas is the **smallest** set  $X$  with the properties

(i)  $p_i \in X$  ( $i \in \mathbb{N}$ ),  $\perp \in X$ ,

(ii)  $A, B \in X \Rightarrow (A \rightarrow B) \in X$ ,

(iii)  $A \in X \Rightarrow (\neg A) \in X$

(iv)  $A \in X \Rightarrow (\square A) \in X$

Let  $\mathbf{Z}$  be a set of formula.

The normal modal logic  $\mathbf{L}[\mathbf{Z}]$  is defined as smallest set  $X$  of formulas verifying the following properties:

1.  $\mathbf{Z} \subseteq \mathbf{X}$

2. if  $A, B, C$  are formulas then  $X$  contains the formulas (called axioms)

**P1**  $A \rightarrow (B \rightarrow A)$

**P2**  $(A \rightarrow (B \rightarrow C)) \rightarrow ((A \rightarrow B) \rightarrow (A \rightarrow C))$

**P3**  $((\neg B \rightarrow \neg A) \rightarrow ((\neg B \rightarrow A) \rightarrow B))$

**P4**  $\Box(A \rightarrow B) \rightarrow (\Box A \rightarrow \Box B)$

3.  $L$  is closed w.r.t. the following operation

**MP** if  $A \in X$  and  $A \rightarrow B \in X$  then  $B \in X$  (modus ponens)

**NEC** if  $A \in X$  then  $\Box A \in X$  (necessitation)

We write  $\vdash_{\mathbf{L}[\mathbf{Z}]} A$  to denote that  $A \in \mathbf{L}[\mathbf{Z}]$

If  $\Omega$  is a finite set of formulas we write  $\Omega \vdash_{\mathbf{L}[\mathbf{Z}]} A$  to denote that  $\vdash_{\mathbf{L}[\mathbf{Z}]} \bigwedge \Omega \rightarrow A$

If  $\Omega$  is an infinite set of formulas we write  $\Omega \vdash_{\mathbf{L}[\mathbf{Z}]} A$  to denote that there is a finite subset  $\Omega_0$  of  $\Omega$  s.t.  $\Omega_0 \vdash_{\mathbf{L}[\mathbf{Z}]} A$ .

$L[\emptyset]$  is called minimal normal modal logic and  $L[\emptyset]$  is denoted simply by **K**

## Abbreviations

The usual abbreviations of classical logic plus

$$\diamond A := \neg \square \neg A$$

If  $N_1, \dots, N_k$  are names of schemas of formula the sequence  $N_1..N_k$  is the set

$N_1^* \cup \dots \cup N_k^*$ , where

$N_i^* = \{A : A \text{ is an instance of the schema } N_i\}$

some schema

$$D. \square A \rightarrow \diamond A$$

$$T. \square A \rightarrow A$$

$$4. \square A \rightarrow \square \square A$$

$$B. A \rightarrow \square \diamond A$$

some modal logic

$$T := L[T]$$

$$S4 := L[T4]$$

$$S5 := L[T4B]$$

$$KT := L[T]$$

$$K4 := L[4]$$

**Possible world semantics  
or  
Kripke semantics**

Let Prop be the set of propositional symbols.

A **structure**  $F = \langle U, R \rangle$ , where  $U$  is a nonempty set and  $R \subseteq U \times U$  is called **frame** ( $\mathcal{F}$  is a graph).

A **valuation** on a frame  $F = \langle U, R \rangle$  is a function  $V : U \rightarrow 2^{\text{Prop}}$ .

A **(Kripke) model**  $M$  is a frame plus a valuation  $V$ ,  $M = \langle U, R, V \rangle$

Let  $M = \langle U, R, V \rangle$  a model,

the satisfiability relation  $M \models \subseteq U \times WFF$

is defined as

1.  $M, w \models A \wedge B \Leftrightarrow M, w \models A$  AND  $M, w \models B$
2.  $M, w \models A \vee B \Leftrightarrow M, w \models A$  OR  $M, w \models B$
3.  $M, w \models \neg A \Leftrightarrow M, w \not\models A,$
4.  $M, w \models A \rightarrow B \Leftrightarrow (M, w \models A \Rightarrow M, w \models B),$
5.  $M, w \models \Box A \Leftrightarrow \forall u (wRu \Rightarrow M, u \models A)$
6.  $M, w \models \Diamond A \Leftrightarrow \exists u (wRu \text{ AND } M, u \models A)$
7.  $M, w \not\models \perp$
8.  $M, w \models p$  iff  $p \in V(w)$

let  $M$  be a model,  $M \models A$  iff for each  $u \in U$  we have  $M, u \models A$

let  $M$  be a model and let  $\Sigma$  be a set of formulas,  $M \models \Sigma$  iff for each  $A \in \Sigma$   $M \models A$

$\models A$  iff for each model  $M$  we have  $M \models A$ .

let  $F$  be a frame,  $F \models A$  iff for each valuation  $V$ ,  $\langle F, V \rangle \models A$

let  $F$  be a frame,  $F, w \models A$  iff for each valuation  $V$ ,  $\langle F, V \rangle, w \models A$

let  $M$  be a model,  $Th(M) = \{A : M \models A\}$

let  $F$  be a ,  $Th(F) = \{A : F \models A\}$

$Md(A) = \{M : M \text{ is a model, } M \models A\}$

$Md(\Sigma) = \{M : M \text{ is a model, } M \models \Sigma\}$

$Fr(A) = \{F : F \text{ is a frame, } F \models A\}$

$Fr(\Sigma) = \{F : F \text{ is a model, } F \models \Sigma\}$

**Theorem 1.2.2 (soundness)** *Let  $\Sigma$  be a set of formulas and let  $M \in Md(\Sigma)$  ( $F \in Fr(\Sigma)$ ) then for each theorem  $A \in \mathbf{L}[\Sigma]$  we have that  $M \models A$  ( $F \models A$ ).*

# Modal definability

## First order translation

Let us assume a modal language with a denumerable set Prop of propositional symbols.

Let us consider a first order language  $L$ , with a denumerable set  $\Pi$  of unary predicate symbols, and a binary predicate symbol  $R$ .

Let  $\tau: \text{Prop} \rightarrow \Pi$  a bijective map

Let Form be the set of first order formula formulas in the language  $L$ .

*Given a fixed variable  $x$ , we define an injective mapping*

*$ST: WFF \rightarrow Form$*

1.  $ST(p) = P(x)$  for  $p \in \text{Prop}$  and  $P = \tau(p)$ ;
2.  $ST(\neg A) = \neg ST(A)$
3.  $ST(A \rightarrow B) = ST(A) \rightarrow ST(B)$
4.  $ST(\Box A) = \forall y(xRy \rightarrow ST(A)[x/y])$  where  $y$  does not occur in  $ST(A)$ .

**definability**

Let  $A(\Sigma)$  be a formula (a set of formulas), we say that  $A(\Sigma)$  defines a first/second order property  $\Phi$  in the language with  $(R, =)$ , if for each  $F$  ( $F \in \text{Fr}(A)$  ( $F \in \text{Fr}(\Sigma)$ ))  $\iff F \models \Phi$

If the set  $\Sigma$  defines the condition  $\Phi$  then we say also that the logic  $L[\Sigma]$  defines  $\Phi$ .

formula name	formula	first order property
<b>D</b>	$\Box A \rightarrow \Diamond A$	$\forall x \exists y. x R y$
<b>T</b>	$\Box A \rightarrow A$	$\forall x. x R x$
<b>4</b>	$\Box A \rightarrow \Box \Box A$	$\forall x y z. (x R y \wedge y R z \rightarrow x R z)$
<b>B</b>	$\Diamond \Box A \rightarrow A$	$\forall x \forall y. (x R y \rightarrow y R x)$
<b>G</b>	$\Diamond \Box A \rightarrow \Box \Diamond A$	$\forall x y z. ((x R y \wedge x R z) \rightarrow \exists w (y R w \wedge z R w))$

**Proposition 1.3.7**  $\Box\alpha \rightarrow \Box\Box\alpha$  defines transitivity  $\forall xyz.(xRy \wedge yRz \rightarrow xRz)$

**PROOF**

**Proposition 1.3.7**  $\Box\alpha \rightarrow \Box\Box\alpha$  defines transitivity  $\forall xyz.(xRy \wedge yRz \rightarrow xRz)$

**Proof.**

1.  $F \models \forall xyz.(xRy \wedge yRz \rightarrow xRz) \Rightarrow F \models \Box\alpha \rightarrow \Box\Box\alpha$ . Let  $F, w \models \Box\alpha$ , and  $w', w''$  s.t.  $wRw', w'Rw''$  then by transitivity we have that  $wRw''$  and therefore  $F, w'' \models \alpha$ ; namely  $F, w' \models \Box\alpha$  and  $F, w \models \Box\Box\alpha$ .
2.  $F \models \Box\alpha \rightarrow \Box\Box\alpha \Rightarrow F \models \forall xyz.(xRy \wedge yRz \rightarrow xRz)$ . Let us suppose that  $F, w \models \Box\alpha \rightarrow \Box\Box\alpha$ ; we fix the following assignment  $V(\alpha) = \{v | wRv\}$ . We have that  $F, V, w \models \Box\alpha$  and by hypothesis  $F, V, w \models \Box\Box\alpha$ . Now for a generic  $v \in V(\alpha)$  let  $w''$  s.t.  $vRw''$ . As  $F, V, w'' \models \alpha$ , we must have that  $R$  is transitive. ■

**Proposition 1.3.8**  $\diamond\Box\alpha \rightarrow \Box\diamond\alpha$  defines directness:

$$dir = \forall xyz((xRy \wedge xRz) \rightarrow \exists u(yRu \wedge zRu))$$

**Proposition 1.3.8**  $\diamond\Box\alpha \rightarrow \Box\diamond\alpha$  defines directness:

$$dir = \forall xyz((xRy \wedge xRz) \rightarrow \exists u(yRu \wedge zRu))$$

## Proof

1.  $F \models \forall xyz((xRy \wedge xRz) \rightarrow \exists u(yRu \wedge zRu)) \Rightarrow F \models \diamond\Box\alpha \rightarrow \Box\diamond\alpha$

Let  $w \in W$  and  $F, w \models \diamond\Box\alpha$  then  $\exists w', wRw'$  s.t.  $\forall w'' w'Rw'' \Rightarrow w'' \models \alpha$ .

As  $dir$  holds we have that  $\forall vwRv \exists sw'Rv, vRs$  as  $F, s \models \alpha$  and therefore  $F, w \models \Box\diamond\alpha$

2.  $F \models \diamond\Box\alpha \supset \Box\diamond\alpha \Rightarrow F \models \forall xyz((xRy \wedge xRz) \rightarrow \exists u(yRu \wedge zRu))$

Let  $w, w', w''$  s.t.  $wRw', wRw''$  and let  $V$  the assignment s.t.  $V(\alpha) = \{s : w'Rv\}$

We have that  $F, w' \models \Box\alpha$  and that  $F, w' \models \diamond\Box\alpha$ . As  $F \models G$  we have that  $F, w \models \Box\diamond\alpha$  and therefore  $\forall vwRv \Rightarrow \exists t F, t \models \alpha \Rightarrow t \in V(\alpha) \Rightarrow F \models dir$

■

$$Fr(\mathbf{K}) = \{ \langle U, R \rangle : R \text{ is a generic relation} \}$$

$$Fr(\mathbf{KD}) = \{ \langle U, R \rangle : R \text{ is total} \}$$

$$Fr(\mathbf{KT}) = \{ \langle U, R \rangle : R \text{ is reflexive} \}$$

$$Fr(\mathbf{S4}) = \{ \langle U, R \rangle : R \text{ is a preorder} \}$$

$$Fr(\mathbf{S5}) = \{ \langle U, R \rangle : R \text{ is an equivalence} \}$$

**COMPLETENESS**

$L[Z]$  is defined as smallest set  $X$  of formulas verifying the following properties:

1.  $Z \subseteq X$
2. if  $A, B, C$  are formulas then  $X$  contains the formulas (called axioms)
  - P1**  $A \rightarrow (B \rightarrow A)$
  - P2**  $(A \rightarrow (B \rightarrow C)) \rightarrow ((A \rightarrow B) \rightarrow (A \rightarrow C))$
  - P3**  $((\neg B \rightarrow \neg A) \rightarrow ((\neg B \rightarrow A) \rightarrow B))$
  - P4**  $\Box(A \rightarrow B) \rightarrow (\Box A \rightarrow \Box B)$
3.  $L$  is closed w.r.t. the following operation
  - MP** if  $A \in X$  and  $A \rightarrow B \in X$  then  $B \in X$  (modus ponens)
  - NEC** if  $A \in X$  then  $\Box A \in X$  (necessitation)

Given a set  $Z$  of modal formulas the modal logic  $L[Z]$  is defined by means of the following axioms and inference rules plus a notion of derivation.

### axioms

1. if  $A, B, C$  are formulas then the following are axioms
  - P1**  $A \rightarrow (B \rightarrow A)$
  - P2**  $(A \rightarrow (B \rightarrow C)) \rightarrow ((A \rightarrow B) \rightarrow (A \rightarrow C))$
  - P3**  $((\neg B \rightarrow \neg A) \rightarrow ((\neg B \rightarrow A) \rightarrow B))$
  - P4**  $\Box(A \rightarrow B) \rightarrow (\Box A \rightarrow \Box B)$
2. if  $A \in Z$  then  $A$  is an axiom

### Inference rules

$$\frac{A \quad A \rightarrow B}{B} \quad \text{MP}$$

$$\frac{A}{\Box A} \quad \text{NEC}$$

### Derivations

A derivation is a finite sequence  $A_1, \dots, A_n$  of formulas s.t. for each  $i \in [1, n]$

$A_i$  is an axiom; or

$A_i \equiv B$  and  $\exists j, k < i$  s.t.  $A_j \equiv A, A_k \equiv A \rightarrow B$ ;

$A_i \equiv \Box A$  and  $\exists k < i$  s.t.  $A_k \equiv A$ ;

We write  $\vdash_{L[Z]} A$  to denote that there is a derivation  $A_1, \dots, A_n$  with  $A_n \equiv A$

# **The construction of the canonical model**

# Maximal Consistent Sets

A set  $\Gamma$  of WFF is **consistent** if

$$\Gamma \not\vdash \perp.$$

A set  $\Gamma$  of WFF is **inconsistent** if

$$\Gamma \vdash \perp.$$

A set  $\Gamma$  is maximally consistent iff

(a)  $\Gamma$  is consistent,

(b)  $\Gamma \subseteq \Gamma'$  and  $\Gamma'$  consistent  $\Rightarrow \Gamma = \Gamma'$ .

**If  $\Gamma$  is maximally consistent, then  $\Gamma$  is closed under derivability (i.e.  $\Gamma \vdash \phi \Rightarrow \phi \in \Gamma$ ).**

## Theorem:

Each consistent set  $\Gamma$  is contained in a maximally consistent set  $\Gamma^*$

1) enumerate all the formulas

$$\varphi_0, \varphi_1, \varphi_2, \dots$$

2) define the non decreasing sequence:

$$\Gamma_0 = \Gamma$$

$$\Gamma_{n+1} = \begin{cases} \Gamma_n \cup \{\varphi_n\} & \text{if } \Gamma_n \cup \{\varphi_n\} \text{ is consistent,} \\ \Gamma_n & \text{otherwise} \end{cases}$$

3) define

$$\Gamma^* = \bigcup_{n \geq 0} \Gamma_n .$$

## Propositional logic:

If  $\Gamma$  is consistent, then there exists a **CANONICAL** valuation such that  $[\psi] = 1$  for all  $\psi \in \Gamma$ .

Let  $L$  be a normal modal logic, a model  $M = \langle U, R, V \rangle$  is called canonical iff

1.  $U = \{w : w \text{ is maximal consistent}\}$
2.  $R = \{(u, v) : \{A : \Box A \in u\} \subseteq v\}$
3.  $u \in V(p) \Leftrightarrow p \in u$

A logic  $L$  is called **canonical** if, taken the canonical model  $\langle U, R, V \rangle$ , we have  $\langle U, R \rangle \in \text{Fr}(L)$ .

### **Theorem CM**

Let  $\langle U, R, V \rangle$  the canonical model of  $L$

$$\vdash_L \alpha \Leftrightarrow \langle U, R, V \rangle \models \alpha$$

A normal modal logic  $L$  is said to be **model complete** if for each formula  $A$ :

$$\vdash_L A \Leftrightarrow \forall M \in Md(L) M \models A$$

## Theorem

Each normal modal logic is model complete

## Proof

( $\Rightarrow$ )

$\vdash_L A \Rightarrow \forall M \in Md(L) M \models A$  by soundness

( $\Leftarrow$ )

In order to prove

$\forall M \in Md(L) M \models A \Rightarrow \vdash_L A$  we use the canonical model.

If  $\forall M \in Md(L) M \models A$  we have in particular that taken the canonical model  $\langle U, R, V \rangle$  we have that  $\langle U, R, V \rangle \models A$ , and applying theorem CM we conclude.

A normal modal logic  $L(\Sigma)$  is said to be **frame complete** if for each formula  $A$ :

$$\vdash_L A \Leftrightarrow \forall F \in \text{Fr}(\Sigma) F \models A$$

**Theorem** The logics  $K$ ,  $KD$ ,  $KT$ ,  $S4$ ,  $S5$ , are frame complete.

**Proof**

Let  $L \in \{K, KD, KT, S4, S5\}$ , it is sufficient to show that if  $\langle U, R, V \rangle$  is the canonical model of  $L$  then the frame  $\langle U, R \rangle \in \text{Fr}(L)$ .

Let  $\Sigma$  be a set of formulas, and let  $\mathcal{C} \subseteq \text{Fr}(\Sigma)$  a set of frames; the modal logic  $L[\Sigma]$  is said to be  **$\mathcal{C}$ -complete** (complete w.r.t. the class  $\mathcal{C}$  of frames) if

$$A \in L(\Sigma) \Leftrightarrow \forall F \in \mathcal{C}, F \models A$$

## Theorem

1. The logics K (KD) is complete with respect to the class of denumerable frames with irreflexive, asymmetric and intransitive (total) accessibility relation.
2. The logic S4 is complete w.r.t. the set of denumerable partial order.

# Modal logic and intuitionism

Let us consider the following translation function  $[\ ]^*$  from propositional formulas to modal ones.

$p^* = \Box p$  ( $p$  is a propositional symbol)

$[A \wedge B]^* = [A]^* \wedge [B]^*$

$[A \vee B]^* = [A]^* \vee [B]^*$

$[A \rightarrow B]^* = \Box ([A]^* \rightarrow [B]^*)$

$[\neg A]^* = \Box (\neg [A]^*)$

## Lemma

Let  $\langle W, R, V_i \rangle$  be an intuitionistic model and  $\langle W, R, V_{S4} \rangle$  be a partial order model of S4 s.t. for each propositional symbol  $p$ ,  
 $w \Vdash_i p$  iff  $w \vDash_{S4} \Box p$ ,  
then for each propositional formula  $A$ ,  $w \Vdash_i A$  iff  $w \vDash_{S4} A^*$

## Lemma

Let  $M_i = \langle W, R, V_i \rangle$  be an intuitionistic model and  $M_{S4} = \langle W, R, V_{S4} \rangle$  be a partial order model of S4 s.t. for each propositional symbol  $p$ ,  
 $w \Vdash_i p$  iff  $w \vDash_{S4} \Box p$ ,  
then for each propositional formula  $A$ ,  $M_i \Vdash_i A$  iff  $M_{S4} \vDash_{S4} A^*$

## Theorem

$$\vdash_i A \Leftrightarrow \vdash_{S4} A^*$$

**natural deduction?**

**There is no general way of giving a proof theory for modal logics.**

The case of S4

$\Box\Gamma, \neg\Diamond\Gamma'$  $\mathcal{D}$  $A$  $\frac{\quad}{\Box A} \Box I$  $\mathcal{D}$  $\Box A$  $\frac{\quad}{A} \Box E$  $\mathcal{D}$  $A$  $\frac{\quad}{\Diamond A} \Diamond I$  $\Box\Gamma, \neg\Diamond\Gamma', [B]$  $\mathcal{D}_1$  $\Diamond B$  $\mathcal{D}_2$  $C$  $\frac{\quad}{C} \Diamond E$

$$\frac{\mathcal{D} \quad A}{\Box A} \Box I$$

$C \in hp \mathcal{D} \Leftrightarrow C$  has the shape either  $\Box B$  or  $\neg \Diamond B$

# failure of normalisation

# TEMPORAL LOGIC

# LTL: Linear Temporal Logic

## timeline/computation/fullpath

Kripke frame is  $\mathbf{Nat} = \langle \mathbb{N}, \sigma, \leq \rangle$   
(as usual  $\sigma(n)$  will be written as  $n+1$ )

each natural number identifies an temporal instant

A Linear Time Kripke model  $\mathbf{M}$  (or, simply, a model) is a frame plus a valuation of propositional symbols, namely  $\mathbf{M} = \langle \mathbf{Nat}, V: \mathbb{N} \rightarrow 2^{\text{Prop}} \rangle$

$\sigma$  induces the accessibility relation

$$\mathcal{N} \subseteq \mathbb{N} \times \mathbb{N}$$

$$n \mathcal{N} m \iff m = n + 1$$

## language of linear temporal logic

alphabet:

(i) proposition symbols :  $p_0, p_1, p_2, \dots,$

(ii) connectives :  $\rightarrow, \perp$

(iii) modal operator  $\bigcirc, \mathcal{U},$

(iv) auxiliary symbols :  $(, ).$

$$AT = \{p_0, p_1, p_2, \dots, \} \cup \{\perp\}$$

The set WFF of (modal) formulas is the **smallest** set  $X$  with the properties

(i)  $p_i \in X$  ( $i \in \mathbb{N}$ ),  $\perp \in X,$

(ii)  $A, B \in X \Rightarrow (A \rightarrow B) \in X,$

(iii)  $A \in X \Rightarrow (\neg A) \in X$

(iv)  $A \in X \Rightarrow (\bigcirc A) \in X$

(v)  $A, B \in X \Rightarrow (A \mathcal{U} B) \in X,$

abbreviations:

$$\diamond A := (\neg \perp) \mathcal{U} A$$

$$\square A := \neg \diamond \neg A$$

Let  $\mathbf{M} = \langle \mathbf{Nat}, V \rangle$  a model,

the satisfiability relation  $\mathbf{M} \models \subseteq \mathbb{N} \times \text{WFF}$

is defined as

1.  $\mathbf{M}, n \models A \wedge B \Leftrightarrow \mathbf{M}, n \models A \ \& \ \mathbf{M}, n \models B$

2.  $\mathbf{M}, n \models A \vee B \Leftrightarrow \mathbf{M}, n \models A \ \text{OR} \ \mathbf{M}, n \models B$

3.  $\mathbf{M}, n \models \neg A \Leftrightarrow \mathbf{M}, n \not\models A,$

4.  $\mathbf{M}, n \models A \rightarrow B \Leftrightarrow (\mathbf{M}, n \models A \Rightarrow \mathbf{M}, n \models B),$

5.  $\mathbf{M}, n \models A \mathcal{U} B \Leftrightarrow \exists m (n \leq m \ \& \ (\mathbf{M}, m \models B \ \& \ \forall j (j \in [n, m-1] \Rightarrow \mathbf{M}, j \models A)))$

6.  $\mathbf{M}, n \models \square A \Leftrightarrow \forall m (n \leq m \Rightarrow \mathbf{M}, m \models A)$

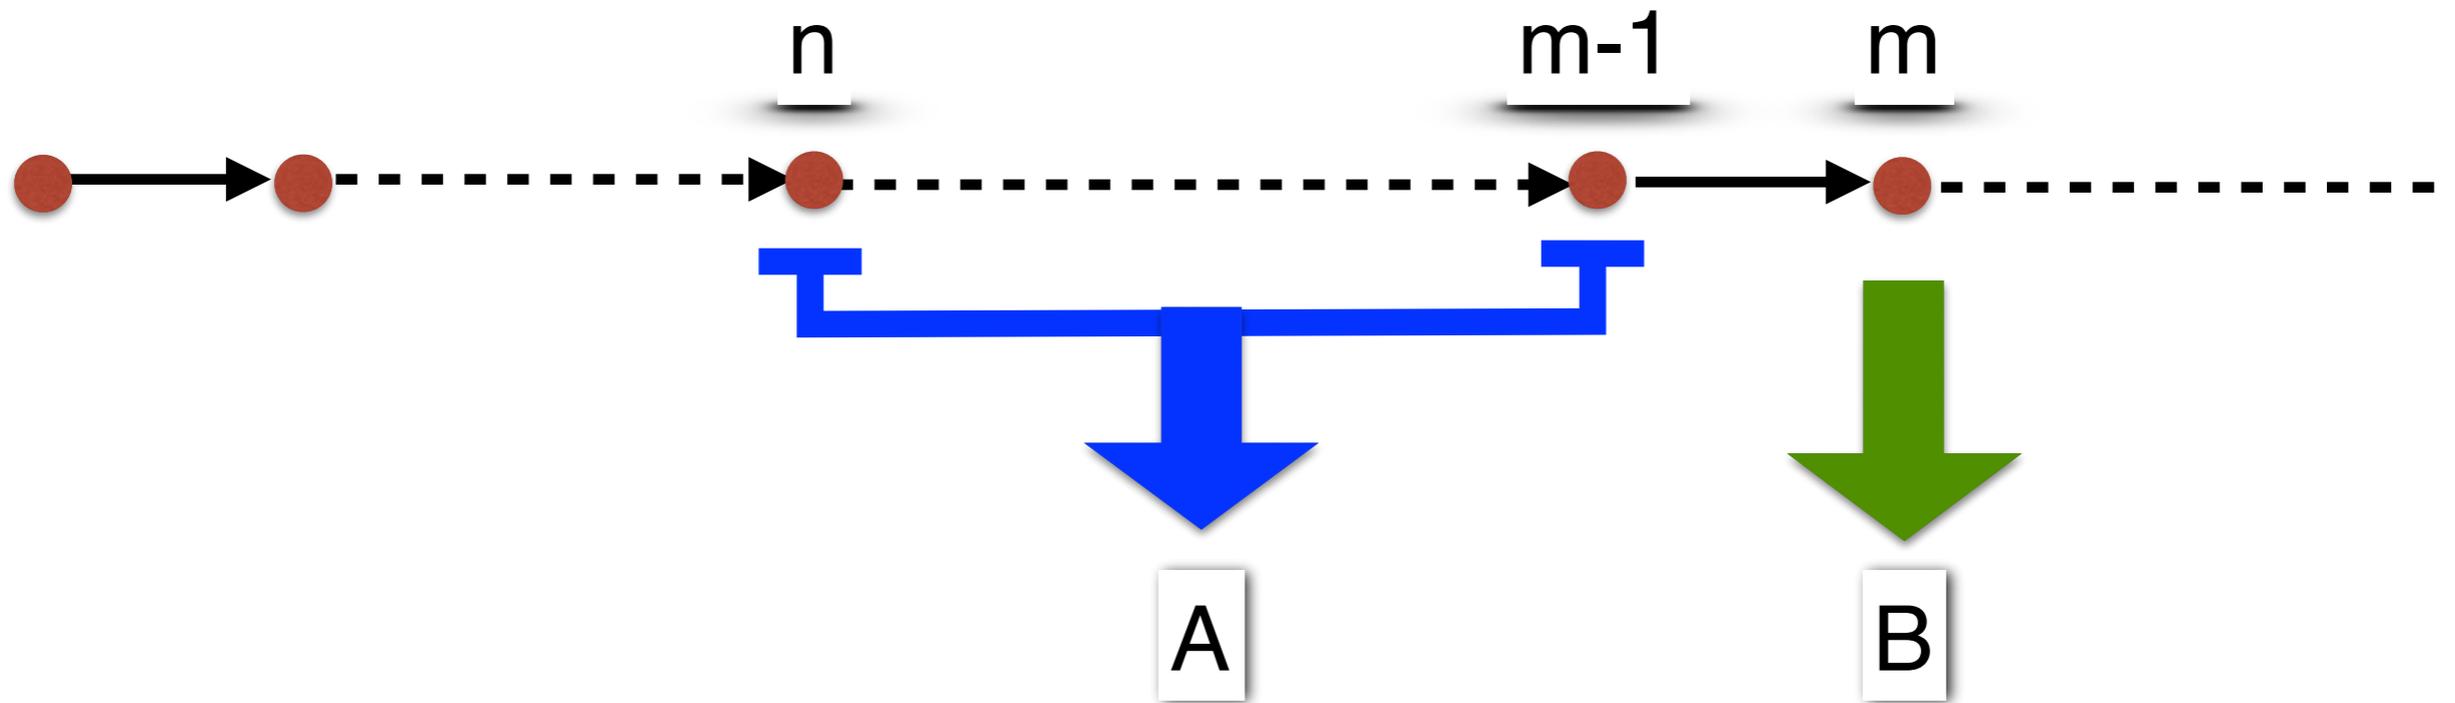

7.  $\mathbf{M}, n \models \diamond A \Leftrightarrow \exists m (n \leq m \ \& \ \mathbf{M}, m \models A)$

8.  $\mathbf{M}, n \models \bigcirc A \Leftrightarrow \mathbf{M}, n+1 \models A)$

9.  $\mathbf{M}, n \not\models \perp$

10.  $\mathbf{M}, n \models p$  iff  $p \in V(n)$

$$M, n \models A \mathcal{U} B \Leftrightarrow \exists m \geq n \ M, m \models B \ \& \ \forall j \in [n, m-1] \ M, j \models A$$

Sometimes in literature a model is given by

$$\mathbf{K} = \langle T, s: \mathbb{N} \rightarrow T, V \rangle$$

where

$T$  is a denumerable set of temporal instants

$s$  is a bijection and

$V: T \rightarrow 2^{\text{Prop}}$  is a valuation

these models are completely equivalent to the models previously introduced.

Let  $\mathbf{K} = \langle T, s: \mathbb{N} \rightarrow T, V \rangle$ ,

the satisfiability relation  $\mathbf{K} \models \subseteq T \times \text{WFF}$   
is defined as

$$M, s_k \models A \rightarrow B \Leftrightarrow (M, s_k \models A \Rightarrow M, s_k \models B),$$

$$M, s_n \models A \mathcal{U} B \Leftrightarrow \exists m (n \leq m \ \& \ (M, s_m \models B \ \& \ \forall j (j \in [n, m-1] \Rightarrow M, s_j \models A)))$$

$$M, s_n \models \bigcirc A \Leftrightarrow M, s_{n+1} \models A$$

$$M, s_n \not\models \perp$$

$$M, s_n \models p \text{ iff } p \in V(s_n)$$

$$M \models A \iff \forall n. M, n \models A$$

$$\models A \iff \forall M. M \models A$$

A0 All temporal instances of propositional classical tautologies.

A1  $\circ(A \rightarrow B) \rightarrow (\circ A \rightarrow \circ B)$

A2  $\neg \circ A \rightarrow \circ \neg A$

A3  $\Box(A \rightarrow B) \rightarrow (\Box A \rightarrow \Box B)$

A4  $\Box A \rightarrow A$

A5  $\Box A \rightarrow \Box \Box A$

A6  $\Box A \rightarrow \circ A$

A7  $\Box A \rightarrow \circ \Box A$

A8  $A \wedge \Box(A \rightarrow \circ A) \rightarrow \Box A$

MP 
$$\frac{A \quad A \rightarrow B}{B}$$

Gen $\Box$  
$$\frac{A}{\Box A}$$

Gen $\circ$  
$$\frac{A}{\circ A}$$

temporal induction

$$A \wedge \Box (A \rightarrow \circ A) \rightarrow \Box A$$

$$0 \models A \wedge \Box (A \rightarrow \circ A) \rightarrow \Box A$$

$\Leftrightarrow$

$$(0 \models A \ \& \ \forall n (n \models A \Rightarrow n+1 \models A)) \Rightarrow \forall n (n \models A)$$

**Let  $a(x)$  be the property  $x \models A$**

$$0 \models A \wedge \Box (A \rightarrow \circ A) \rightarrow \Box A$$

$\Leftrightarrow$

$$(a(0) \ \& \ \forall n (a(n) \Rightarrow a(n+1))) \Rightarrow \forall n (a(n))$$

$$k \models A \wedge \Box (A \rightarrow \circ A) \rightarrow \Box A$$

$\Leftrightarrow$

$$(a(k) \ \& \ \forall n \geq k (a(n) \Rightarrow a(n+1))) \Rightarrow \forall n \geq k (a(n))$$

# SOUNDNESS

$$\vdash A \Rightarrow \models A$$

(A simple induction on derivations: exercise)

# COMPLETENESS

$$\models A \Rightarrow \vdash A$$

Difficult: the canonical kripke model is not a temporal model

**BRANCHING TIME**

# INTUITIVE IDEA: TREES/GRAPHS instead of COMPUTATIONS

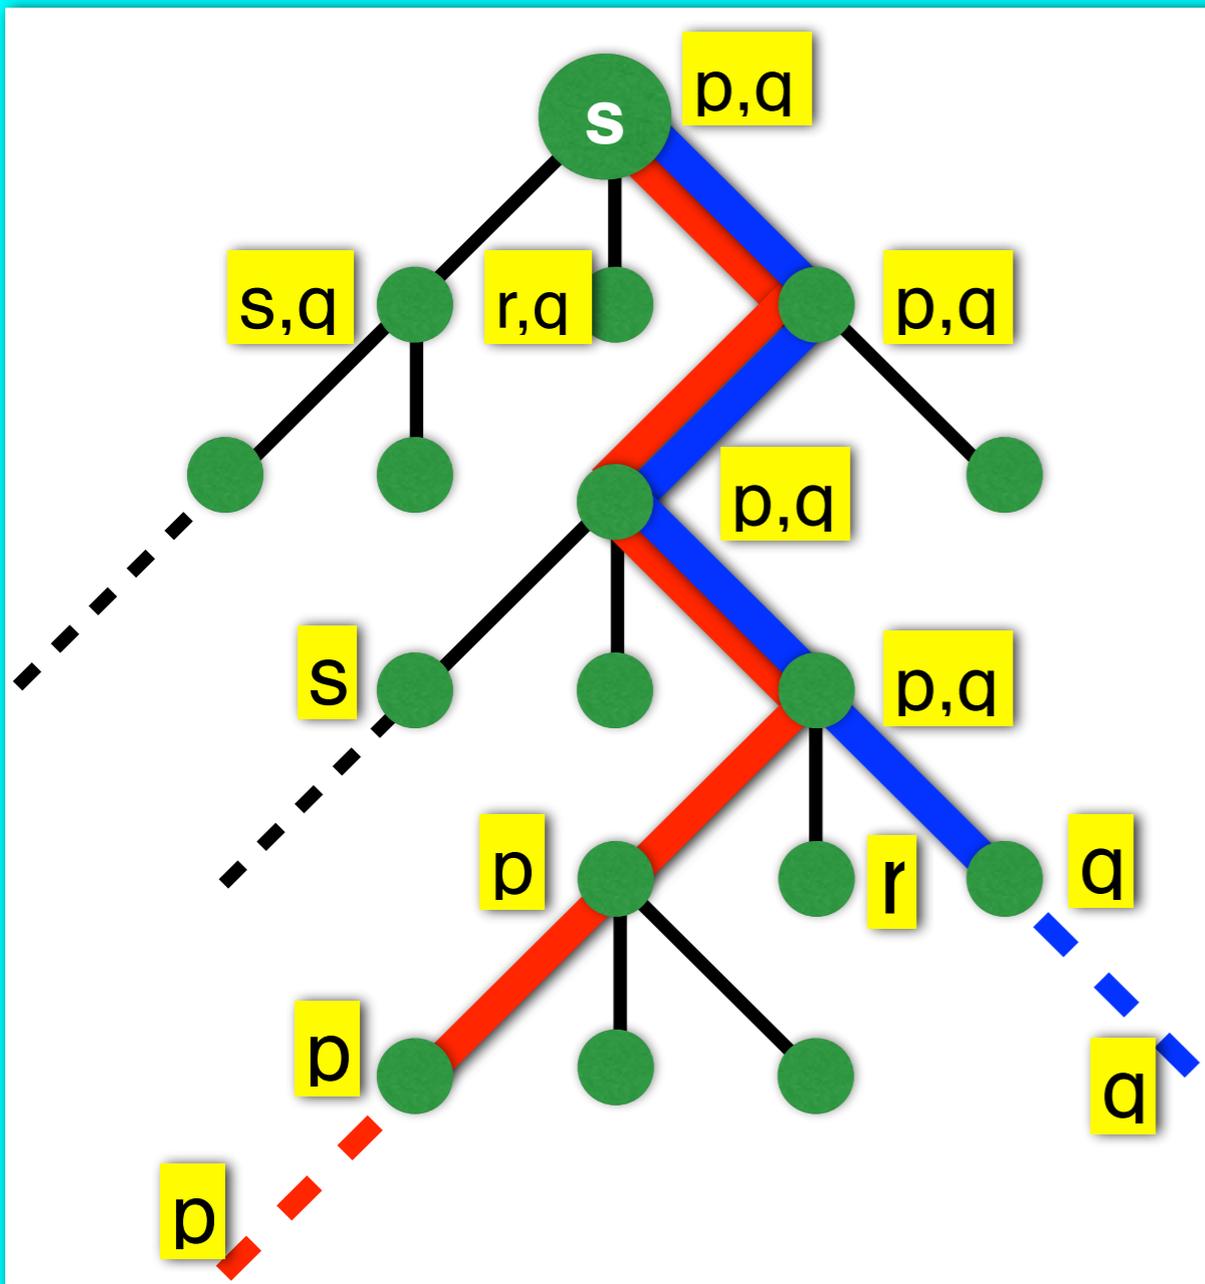

$\forall \bigcirc$  = for each next time;  $\exists \bigcirc$  = there exists a next time such that

$\forall \square$  = for each computation and for each state in it

$\forall \diamond$  = for each computation there exists a state in it such that

$\exists \square$  = there exists a computation such that for each state in it

$\exists \diamond$  = there exists a computation and a state in it such that

$$s \models \forall \bigcirc p$$

$$s \models \exists \bigcirc (s \wedge \exists \bigcirc p)$$

$$s \models \exists \square p$$

$$s \models \exists \square q$$

$$s \models \exists \diamond r$$

$$s \models \exists \diamond (s \wedge \neg q)$$

# language of UB

alphabet:

(i) proposition symbols :  $p_0, p_1, p_2, \dots,$

(ii) connectives :  $\rightarrow, \perp$

(iii) modal operator  $\forall\bigcirc, \forall\Box, \forall\Diamond$

(iv) auxiliary symbols :  $(, )$ .

$$AT = \{p_0, p_1, p_2, \dots\} \cup \{\perp\}$$

The set WFF of (modal) formulas is the **smallest** set  $X$  with the properties

(i)  $p_i \in X$  ( $i \in \mathbb{N}$ ),  $\perp \in X$ ,

(ii)  $A, B \in X \Rightarrow (A \rightarrow B) \in X$ ,

(iii)  $A \in X \Rightarrow (\neg A) \in X$

(iv)  $A \in X \Rightarrow (\forall\Diamond A), (\forall\Box A), (\forall\bigcirc A) \in X$

abbreviations:

$$\exists\Box A := \neg\forall\Diamond\neg A$$

$$\exists\Diamond A := \neg\forall\Box\neg A$$

$$\exists\bigcirc A := \neg\forall\bigcirc\neg A$$

# Semantics

an (UB-)frame is a graph

$$\langle S, N \rangle$$

where  $N \subseteq S \times S$  is total ( $\forall s \exists s' s N s'$ )

An s-branch/s-computation is a sequence

$$b_s = (s_i)_{i < \omega} \text{ s.t. } s = s_0 \ \& \ \forall i \in \mathbb{N} \ s_i N s_{i+1}$$

if  $b_s = (s_i)_{i < \omega}$  with  $b_s[k]$  we denote  $s_k$  and with  $s' \in b_s$  we mean that  $\exists k$  s.t.  $s' = b_s[k]$

an (UB-)model is a pair

$$\langle F, V \rangle$$

where  $F$  is a frame

and  $V: S \rightarrow 2^{\text{Prop}}$

is a valuation

Let  $M = \langle S, N, V \rangle$  a model,

the satisfiability relation  $M \models \subseteq S \times \text{WFF}$

is defined as

1.  $M, s \not\models \perp$
2.  $M, s \models p$  iff  $p \in V(s)$
3.  $M, s \models A \wedge B \Leftrightarrow M, s \models A \ \& \ M, s \models B$
4.  $M, s \models A \vee B \Leftrightarrow M, s \models A \ \text{OR} \ M, s \models B$
5.  $M, s \models \neg A \Leftrightarrow M, s \not\models A,$
6.  $M, s \models A \rightarrow B \Leftrightarrow (M, s \models A \Rightarrow M, s \models B),$
7.  $M, s \models \forall \square A \Leftrightarrow \forall b_s \forall s' \in b_s \ M, s' \models A$
8.  $M, s \models \forall \diamond A \Leftrightarrow \forall b_s \exists s' \in b_s \ M, s' \models A$
9.  $M, s \models \exists \square A \Leftrightarrow \exists b_s \forall s' \in b_s \ M, s' \models A$
10.  $M, s \models \exists \diamond A \Leftrightarrow \exists b_s \exists s' \in b_s \ M, s' \models A$
11.  $M, s \models \forall \bigcirc A \Leftrightarrow \forall s' (s N s' \Rightarrow M, s' \models A)$
12.  $M, s \models \exists \bigcirc A \Leftrightarrow \exists s' (s N s' \ \& \ M, s' \models A)$

# AXIOMATIZATION ( $\mathcal{U}$ -free fragment)

A0 All temporal instances of propositional classical tautologies.

- . (A1)  $\forall \Box (A \rightarrow B) \supset (\forall \Box A \rightarrow \forall \Box B)$
- . (A2)  $\forall \bigcirc (A \rightarrow B) \supset (\forall \bigcirc A \rightarrow \forall \bigcirc B)$
- . (A3)  $\forall \Box A \rightarrow (\forall \Box A \wedge \forall \bigcirc \forall \Box A)$
- . (A4)  $A \wedge \forall \Box (A \rightarrow \forall \bigcirc A) \rightarrow \forall \Box A$
- . (E1)  $\forall \Box (A \rightarrow B) \supset (\exists \Box A \rightarrow \exists \Box B)$
- . (E2)  $\exists \Box A \rightarrow (A \wedge \exists \bigcirc \exists \Box A)$
- . (E3)  $\forall \Box A \rightarrow \exists \Box A$
- . (E4)  $A \wedge \forall \Box (A \rightarrow \exists \bigcirc A) \rightarrow \exists \Box A$

$$\text{MP} \quad \frac{A \quad A \rightarrow B}{B}$$

$$\text{Gen} \quad \frac{A}{\forall \Box A}$$

# SOUNDNESS

$$\vdash A \Rightarrow \models A$$

(A simple induction on derivations: exercise)

# COMPLETENESS

$$\models A \Rightarrow \vdash A$$

Difficult: the canonical kripke model is not an UB-model

The Logic CTL

CTL = UB + *Until*

## language of CTL

alphabet:

(i) proposition symbols :  $p_0, p_1, p_2, \dots,$

(ii) connectives :  $\rightarrow, \perp$

(iii) modal operator  $\forall \bigcirc, \forall \mathcal{U}, \exists \mathcal{U}$

(iv) auxiliary symbols :  $(, )$ .

$\mathcal{AT} = \{p_0, p_1, p_2, \dots, \} \cup \{\perp\}$

The set WFF of (modal) formulas is the **smallest** set  $X$  with the properties

(i)  $p_i \in X$  ( $i \in \mathbb{N}$ ),  $\perp \in X$ ,

(ii)  $A, B \in X \Rightarrow (A \rightarrow B) \in X$ ,

(iii)  $A \in X \Rightarrow (\neg A) \in X$

(iv)  $A, B \in X \Rightarrow (\forall \bigcirc A), (A \forall \mathcal{U} B) \in X$

abbreviations:

$\exists \bigcirc A = \neg \forall \bigcirc \neg A$

$\exists \square A = \neg \forall \square \neg A$     $\forall \square A = \neg \exists \square \neg A$     $\exists \diamond a \equiv \text{true} \exists \mathcal{U} A$     $\forall \diamond A \equiv \text{true} \forall \mathcal{U} A$

**NOTATION:** if  $b_s = (s_i)_{i < \omega}$  with  $b_s[k]$  we denote  $s_k$

$M, s \models B \exists \mathcal{U} A$

$\Leftrightarrow$

$\exists b_s \exists k ( M, b_s[k] \models A \ \& \ \forall j \in [0, k-1] b_s[j] \models B$

$M, s \models B \forall \mathcal{U} A$

$\Leftrightarrow$

$\forall b_s \exists k ( M, b_s[k] \models A \ \& \ \forall j \in [0, k-1] b_s[j] \models B$

in order to axiomatize CTL we add to the axioms of UB the following

$$\forall \square (C \rightarrow (\neg B \wedge (A \rightarrow \forall \bigcirc C))) \rightarrow (C \rightarrow \neg (A \exists \mathcal{U} B))$$

$$\forall \square (C \rightarrow (\neg B \wedge \exists \bigcirc C)) \rightarrow (C \rightarrow \neg (A \forall \mathcal{U} B))$$

# SOUNDNESS

$$\vdash A \Rightarrow \models A$$

(A simple induction on derivations: exercise)

# COMPLETENESS

$$\models A \Rightarrow \vdash A$$

Difficult: the canonical kripke model is not CTL-model

# Model Checking

Given a model  $M$  and a formula  $A$   
 $M \models A$  ?

model checking is important for verification of properties of concurrent and distributed systems.

$M$  represent the computational space and  $A$  the property to be verified

## Theorem

The model checking problem for CTL is in deterministic polynomial time

## Theorem

The model checking problem for LTL is PSPACE-complete
