# Separable Wavelet bases

- To any wavelet orthonormal basis  $\{\psi_{j,n}\}_{(j,n)\in\mathbb{Z}^2}$  of  $\mathbf{L}^2(\mathbb{R})$ , one can associate a separable wavelet orthonormal basis of  $\mathbf{L}^2(\mathbb{R}^2)$ :

$$\left\{ \psi_{j_1,n_1}(x_1) \psi_{j_2,n_2}(x_2) \right\}_{(j_1,j_2,n_1,n_2)\in\mathbb{Z}^4}$$

- The functions  $\psi_{j_1,n_1}(x_1)$  and  $\psi_{j_2,n_2}(x_2)$  mix informations at two different scales along  $x_1$  and  $x_2$ , which is something that we could want to avoid
- Separable multiresolutions lead to another construction of separable wavelet bases with wavelets that are products of functions dilated at the same scale.

# Separable multiresolutions

- The notion of resolution is formalized with orthogonal projections in spaces of various sizes.
- The approximation of an image  $f(x_1, x_2)$  at the resolution  $2^{-j}$  is defined as the orthogonal projection of  $f$  on a space  $\mathbf{V}_2^j$  that is included in  $\mathbf{L}^2(\mathbf{R}^2)$
- The space  $\mathbf{V}_2^j$  is the set of all approximations at the resolution  $2^{-j}$ .
  - When the resolution decreases, the size of  $\mathbf{V}_2^j$  decreases as well.
- The formal definition of a multiresolution approximation  $\{\mathbf{V}_2^j\}_{j \in \mathbf{Z}}$  of  $\mathbf{L}^2(\mathbf{R}^2)$  is a straightforward extension of Definition 7.1 that specifies multiresolutions of  $\mathbf{L}^2(\mathbf{R})$ .
  - The same causality, completeness, and scaling properties must be satisfied.

# Separable spaces and bases

- Tensor product
  - Used to extend spaces of 1D signals to spaces of multi-dimensional signals
  - A tensor product  $x_1 \otimes x_2$  between vectors of two Hilbert spaces  $H_1$  and  $H_2$  satisfies the following properties

## *Linearity*

$$\forall \lambda \in \mathbb{C}, \lambda(x_1 \otimes x_2) = (\lambda x_1) \otimes x_2 = x_1 \otimes (\lambda x_2)$$

## *Distributivity*

$$(x_1 + y_1) \otimes (x_2 + y_2) = (x_1 \otimes x_2) + (x_1 \otimes y_2) + (y_1 \otimes x_2) + (y_1 \otimes y_2) +$$

- This tensor product yields a new Hilbert space  $H = H_1 \otimes H_2$  including all the vectors of the form  $x_1 \otimes x_2$  where  $x_1 \in H_1$  and  $x_2 \in H_2$  as well as a linear combination of such vectors
- An inner product for  $H$  is derived as  $\langle x_1 \otimes x_2, y_1 \otimes y_2 \rangle = \langle x_1, y_1 \rangle_{H_1} \langle x_2, y_2 \rangle_{H_2}$

# Separable bases

- **Theorem A.3** Let  $H = H_1 \otimes H_2$ . If  $\{e_n^1\}_{n \in \mathbb{N}}$  and  $\{e_n^2\}_{n \in \mathbb{N}}$  are Riesz bases of  $H_1$  and  $H_2$ , respectively, then  $\{e_n^1 \otimes e_m^2\}_{n,m \in \mathbb{N}^2}$  is a Riesz basis for  $H$ . If the two bases are orthonormal then the tensor product basis is also orthonormal.

→ To any wavelet orthonormal basis one can associate a separable wavelet orthonormal basis of  $L^2(\mathbb{R}^2)$   $\{\psi_{j,n}(x), \psi_{l,m}(y)\}_{(j,n,l,m) \in \mathbb{Z}^4}$

However, wavelets  $\psi_{j,n}(x)$  and  $\psi_{l,m}(y)$  mix the information at *two different scales* along  $x$  and  $y$ , which often we want to avoid.

# Separable Wavelet bases

- Separable multiresolutions lead to another construction of separable wavelet bases whose elements are products of functions dilated at the same scale.
- We consider the particular case of separable multiresolutions
- A separable 2D multiresolution is composed of the tensor product spaces

$$V_j^2 = V_j \otimes V_j$$

- $V_j^2$  is the space of finite energy functions  $f(x,y)$  that are linear expansions of separable functions

$$f(x, y) = \sum_n a[n] f_n(x) g_n(y) \quad f_n \in V_j \quad g_n \in V_j$$

- If  $\{V_j\}_{j \in \mathbb{Z}}$  is a multiresolution approximation of  $L^2(\mathbb{R})$ , then  $\{V_j^2\}_{j \in \mathbb{Z}}$  is a multiresolution approximation of  $L^2(\mathbb{R}^2)$ .

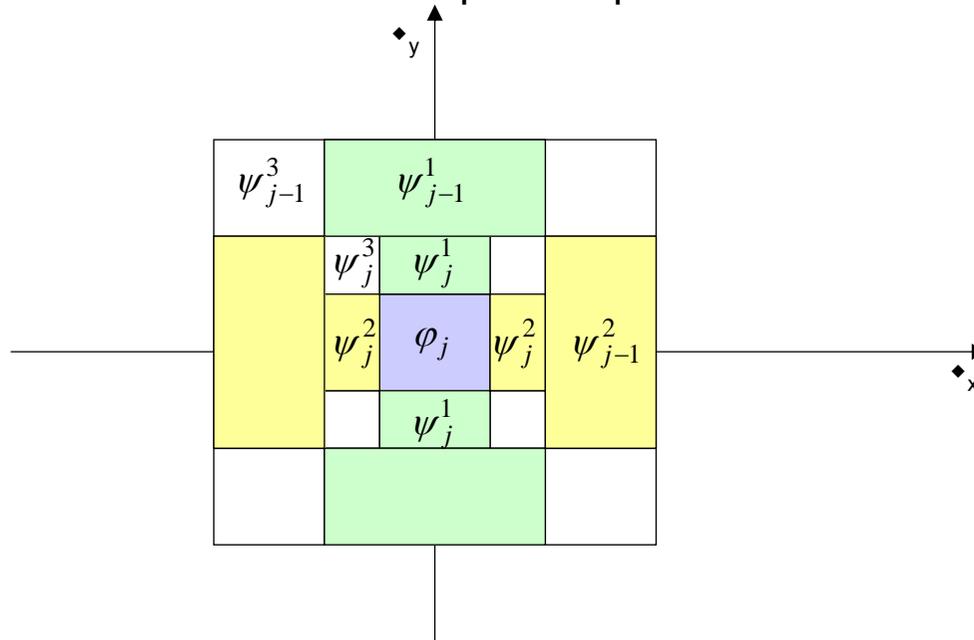

# Separable bases

It is possible to prove (Theorem A.3) that

$$\left\{ \varphi_{j,n,m}(x, y) = \varphi_{j,n}(x)\varphi_{j,m}(y) = \frac{1}{2^j} \varphi\left(\frac{x-2^j n}{2^j}\right) \varphi\left(\frac{y-2^j m}{2^j}\right) \right\}_{(n,m) \in \mathbb{Z}^2}$$

is an orthonormal basis of  $V_j^2$ .

A 2D wavelet basis is constructed with separable products of a scaling function and a wavelet

# Examples

---

## EXAMPLE 7.13: Piecewise Constant Approximation

Let  $\mathbf{V}_j$  be the approximation space of functions that are constant on  $[2^j m, 2^j(m+1)]$  for any  $m \in \mathbb{Z}$ . The tensor product defines a two-dimensional piecewise constant approximation. The space  $\mathbf{V}_j^2$  is the set of functions that are constant on any square  $[2^j n_1, 2^j(n_1+1)] \times [2^j n_2, 2^j(n_2+1)]$ , for  $(n_1, n_2) \in \mathbb{Z}^2$ . The two-dimensional scaling function is

$$\phi^2(x) = \phi(x_1) \phi(x_2) = \begin{cases} 1 & \text{if } 0 \leq x_1 \leq 1 \text{ and } 0 \leq x_2 \leq 1 \\ 0 & \text{otherwise.} \end{cases}$$

---

---

## EXAMPLE 7.14: Shannon Approximation

Let  $\mathbf{V}_j$  be the space of functions with Fourier transforms that have a support included in  $[-2^{-j}\pi, 2^{-j}\pi]$ . Space  $\mathbf{V}_j^2$  is the set of functions the two-dimensional Fourier transforms of which have a support included in the low-frequency square  $[-2^{-j}\pi, 2^{-j}\pi] \times [-2^{-j}\pi, 2^{-j}\pi]$ . The two-dimensional scaling function is a perfect two-dimensional low-pass filter the Fourier transform of which is

$$\hat{\phi}(\omega_1) \hat{\phi}(\omega_2) = \begin{cases} 1 & \text{if } |\omega_1| \leq 2^{-j}\pi \text{ and } |\omega_2| \leq 2^{-j}\pi \\ 0 & \text{otherwise.} \end{cases}$$

---

# Separable wavelet bases

- A separable wavelet orthonormal basis of  $\mathbf{L}^2(\mathbf{R}^2)$  is constructed with separable products of a scaling function and a wavelet .
- The scaling function is associated to a one-dimensional multiresolution approximation  $\{\mathbf{V}_j\}_{j \in \mathbf{Z}}$ .
- Let  $\{\mathbf{V}_2^j\}_{j \in \mathbf{Z}}$  be the separable two-dimensional multiresolution defined by

$$V_j^2 = V_j \otimes V_j$$

- Let  $\mathbf{W}_2^j$  be the detail space equal to the orthogonal complement of the lower-resolution approximation space  $\mathbf{V}_2^j$  in  $\mathbf{V}_2^{j-1}$ :

$$V_{j-1}^2 = V_j^2 \oplus W_j^2$$

- To construct a wavelet orthonormal basis of  $\mathbf{L}^2(\mathbf{R}^2)$ , Theorem 7.25 builds a wavelet basis of each detail space  $\mathbf{W}_2^j$  .

# Separable wavelet bases

## Theorem 7.25

Let  $\varphi$  be a scaling function and  $\psi$  be the corresponding wavelet generating an orthonormal basis of  $L^2(\mathbb{R})$ . We define three wavelets

$$\psi^1(x, y) = \varphi(x)\psi(y)$$

$$\psi^2(x, y) = \psi(x)\varphi(y)$$

and denote for  $1 \leq k \leq 3$

$$\psi^3(x, y) = \psi(x)\psi(y)$$

$$\psi_{j,n,m}^k(x, y) = \frac{1}{2^j} \psi^k\left(\frac{x - 2^j n}{2^j}, \frac{y - 2^j m}{2^j}\right)$$

The wavelet family

$$\left\{ \psi_{j,n,m}^1(x, y), \psi_{j,n,m}^2(x, y), \psi_{j,n,m}^3(x, y) \right\}_{(n,m) \in \mathbb{Z}^2}$$

is an orthonormal basis of  $W_j^2$  and

$$\left\{ \psi_{j,n,m}^1(x, y), \psi_{j,n,m}^2(x, y), \psi_{j,n,m}^3(x, y) \right\}_{(j,n,m) \in \mathbb{Z}^3}$$

is an orthonormal basis of  $L^2(\mathbb{R}^2)$

On the same line, one can define **biorthogonal** 2D bases.

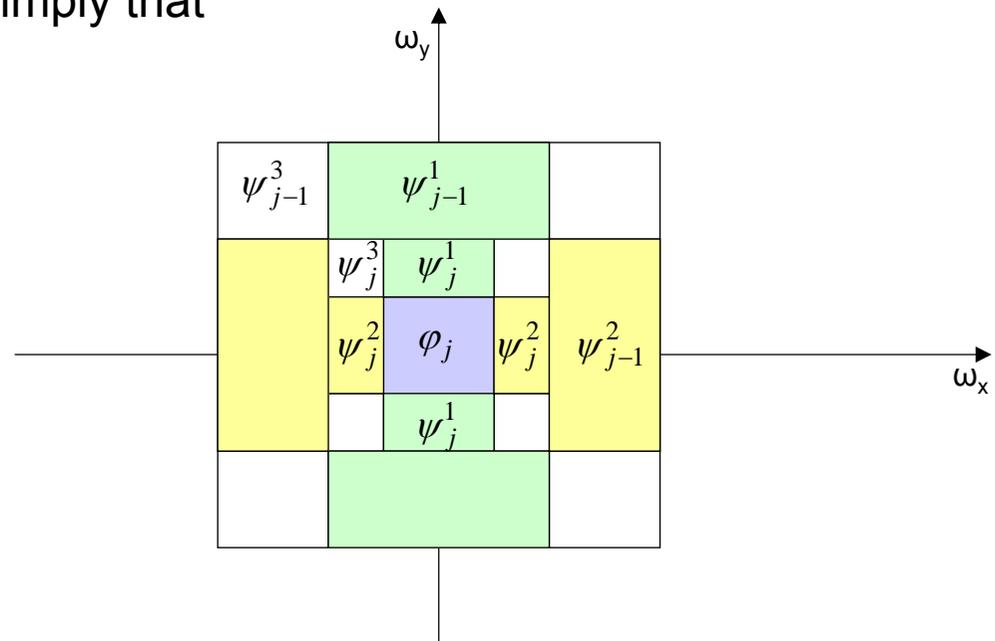

# Separable wavelet bases

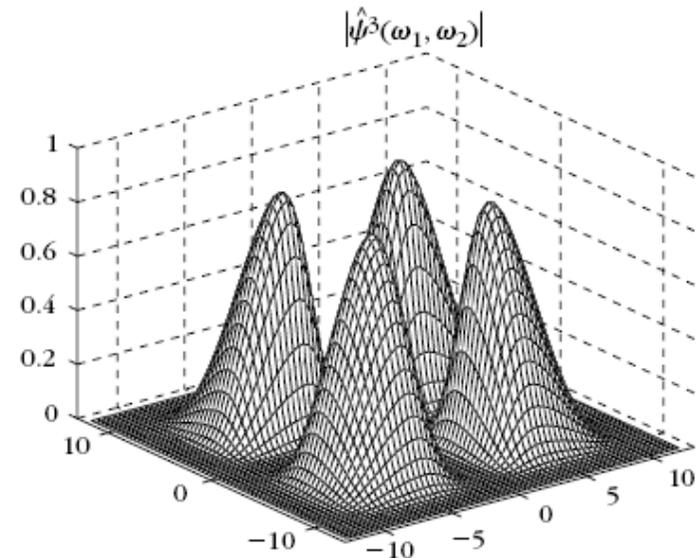

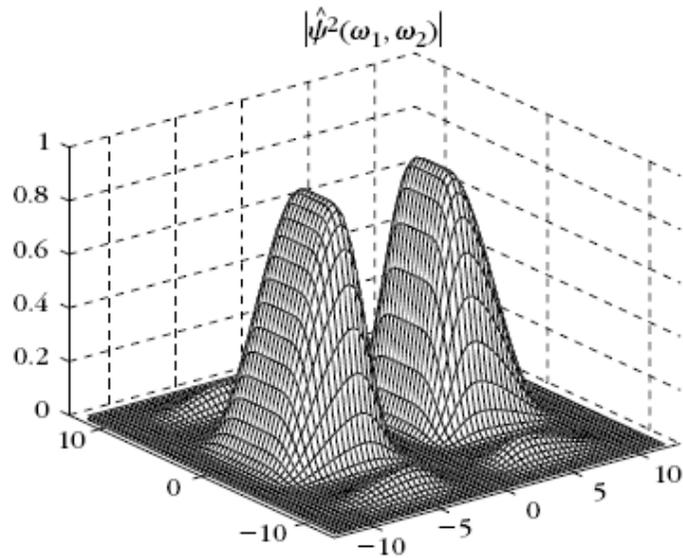

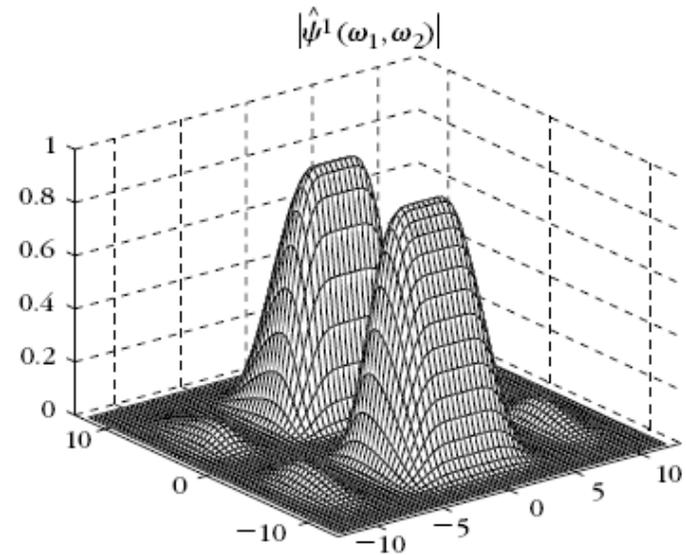

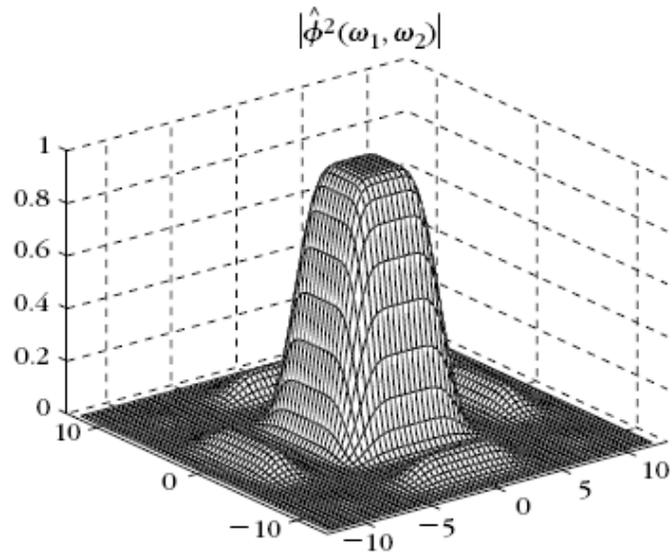

- The three wavelets extract image details at different scales and in different directions.
- Over positive frequencies,  $\hat{\phi}(\omega)$  and  $\hat{\psi}(\omega)$  have an energy mainly concentrated, respectively, on  $[0, \pi]$  and  $[\pi, 2\pi]$ .
- The separable wavelet expressions imply that

$$\hat{\psi}^1(\omega_x, \omega_y) = \hat{\phi}(\omega_x) \hat{\psi}(\omega_y)$$

$$\hat{\psi}^2(\omega_x, \omega_y) = \hat{\psi}(\omega_x) \hat{\phi}(\omega_y)$$

$$\hat{\psi}^3(\omega_x, \omega_y) = \hat{\psi}(\omega_x) \hat{\psi}(\omega_y)$$

# Bi-dimensional wavelets

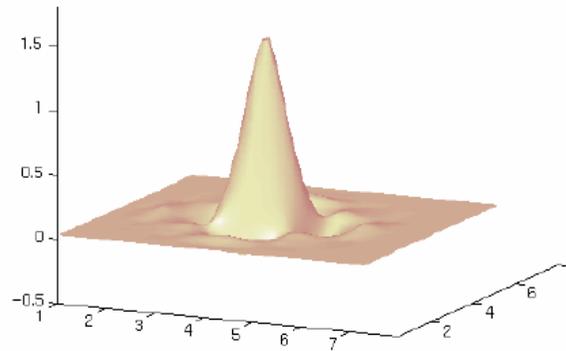

$$\varphi(x, y) = \varphi(x)\varphi(y)$$

$$\psi^1(x, y) = \varphi(x)\psi(y)$$

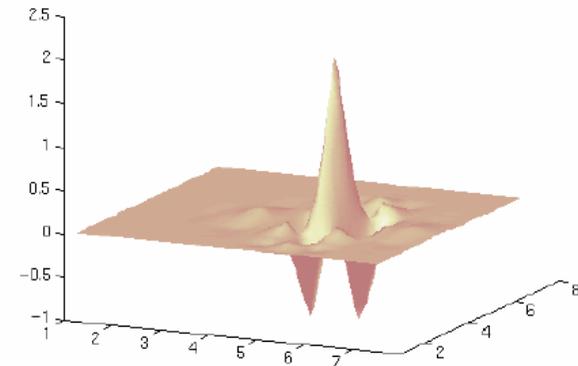

$$\psi^2(x, y) = \psi(x)\varphi(y)$$

$$\psi^3(x, y) = \psi(x)\psi(y)$$

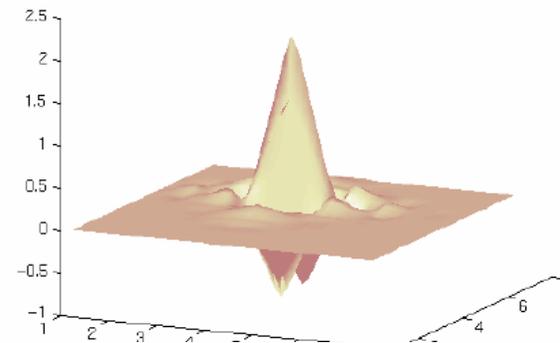

coef2: phi(x)\*phi(y).

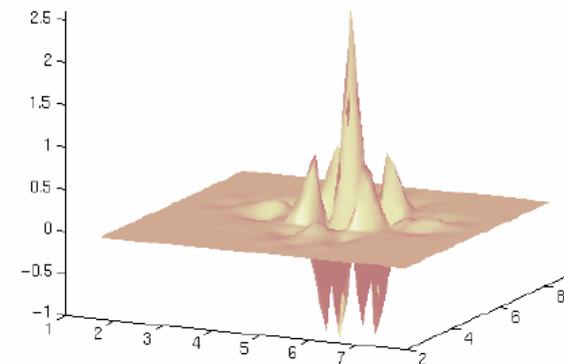

coef2: phi(x)\*psi(y).

coef2: psi(x)\*phi(y).

coef2: psi(x)\*psi(y).

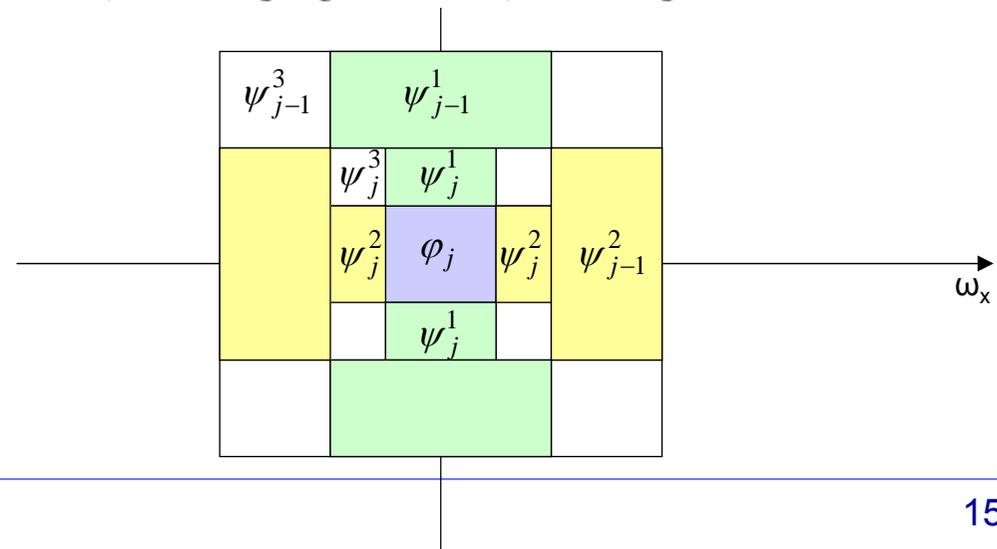

$$\frac{1}{\sqrt{a_1 a_2}} \psi\left(\frac{x_1 - b_1}{a_1}, \frac{x_2 - b_2}{a_2}\right) \text{ where } (x = (x_1, x_2) \in \mathbb{R}^2)$$

# Example: Shannon wavelets

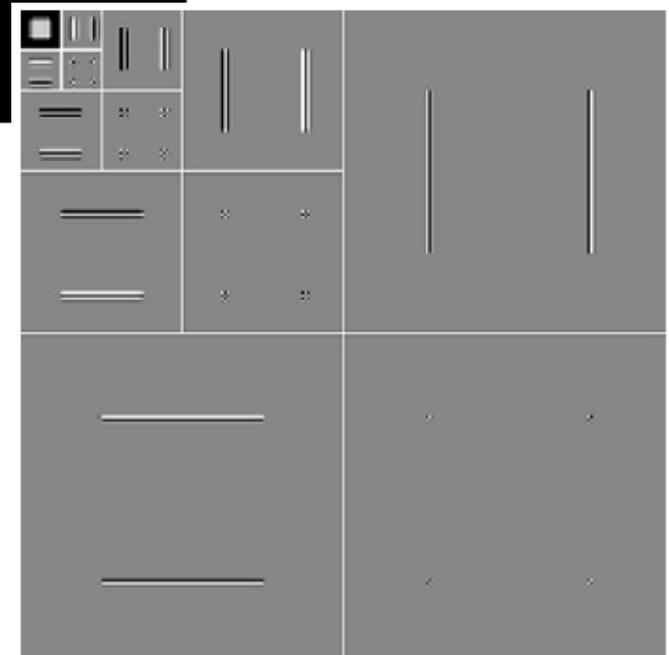

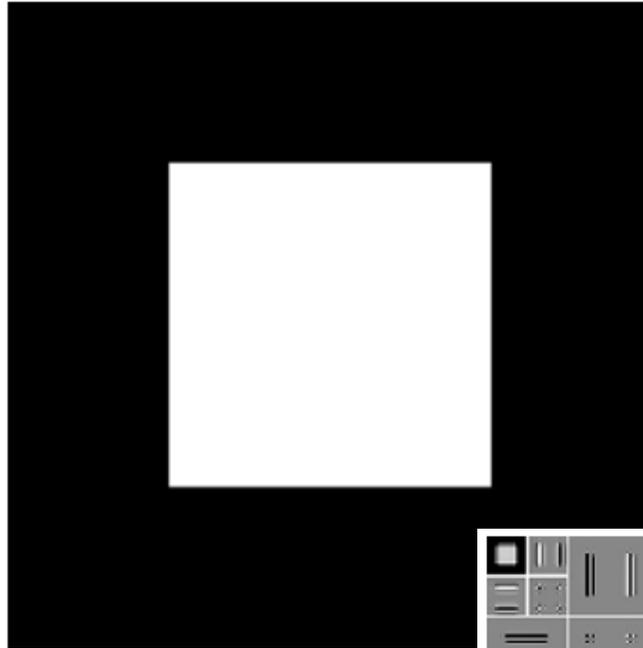

## EXAMPLE 7.16

For a Shannon multiresolution approximation, the resulting two-dimensional wavelet basis paves the two-dimensional Fourier plane  $(\omega_1, \omega_2)$  with dilated rectangles. The Fourier transforms  $\hat{\phi}$  and  $\hat{\psi}$  are the indicator functions of  $[-\pi, \pi]$  and  $[-2\pi, -\pi] \cup [\pi, 2\pi]$ , respectively. The separable space  $\mathbf{V}_j^2$  contains functions with a two-dimensional Fourier transform support included in the low-frequency square  $[-2^{-j}\pi, 2^{-j}\pi] \times [-2^{-j}\pi, 2^{-j}\pi]$ . This corresponds to the support of  $\hat{\phi}_{j,n}^2$  indicated in Figure 7.23.

The detail space  $\mathbf{W}_j^2$  is the orthogonal complement of  $\mathbf{V}_j^2$  in  $\mathbf{V}_{j-1}^2$  and thus includes functions with Fourier transforms supported in the frequency annulus between the two squares  $[-2^{-j}\pi, 2^{-j}\pi] \times [-2^{-j}\pi, 2^{-j}\pi]$  and  $[-2^{-j+1}\pi, 2^{-j+1}\pi] \times [-2^{-j+1}\pi, 2^{-j+1}\pi]$ .

$a_{L+3}$	$d_{L+3}^2$	$d_{L+2}^2$	
$d_{L+3}^1$	$d_{L+3}^3$		
$d_{L+2}^1$	$d_{L+2}^3$	$d_{L+1}^2$	
$d_{L+1}^1$		$d_{L+1}^3$	

## Biorthogonal separable wavelets

Let  $\varphi, \psi, \tilde{\varphi}$  and  $\tilde{\psi}$  be a two dual pairs of scaling functions and wavelets that generate a biorthogonal wavelet basis of  $L^2(\mathbb{R})$ .

The dual wavelets of  $\psi^1, \psi^2$  and  $\psi^3$  are

$$\tilde{\psi}^1(x, y) = \tilde{\varphi}(x)\tilde{\psi}(y)$$

$$\tilde{\psi}^2(x, y) = \tilde{\psi}(x)\tilde{\varphi}(y)$$

$$\tilde{\psi}^3(x, y) = \tilde{\psi}(x)\tilde{\psi}(y)$$

One can verify that

$$\{\psi_{j,n}^1, \psi_{j,n}^2, \psi_{j,n}^3\}_{j,n \in \mathbb{Z}^3}$$

and

$$\{\tilde{\psi}_{j,n}^1, \tilde{\psi}_{j,n}^2, \tilde{\psi}_{j,n}^3\}_{j,n \in \mathbb{Z}^3}$$

are biorthogonal Riesz basis of  $L^2(\mathbb{R}^2)$

# Fast 2D Wavelet Transform

$$a_j[n, m] = \langle f, \varphi_{j,n,m} \rangle$$

Approximation at scale j

$$d_j^k[n, m] = \langle f, \psi_{j,n,m}^k \rangle$$

Details at scale j

$$k = 1, 2, 3$$

$$[a_J, \{d_j^1, d_j^2, d_j^3\}_{1 \leq j \leq J}]$$

Wavelet representation

Analysis

$$a_{j+1}[n, m] = a_j * \bar{h}\bar{h}[2n, 2m]$$

$$d_{j+1}^1[n, m] = a_j * \bar{h}\bar{g}[2n, 2m]$$

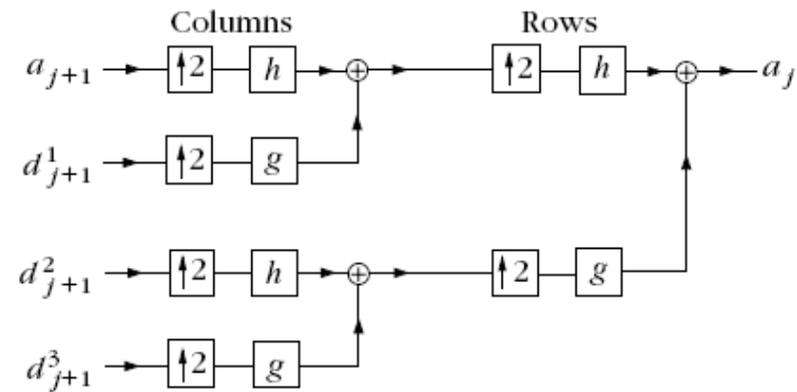

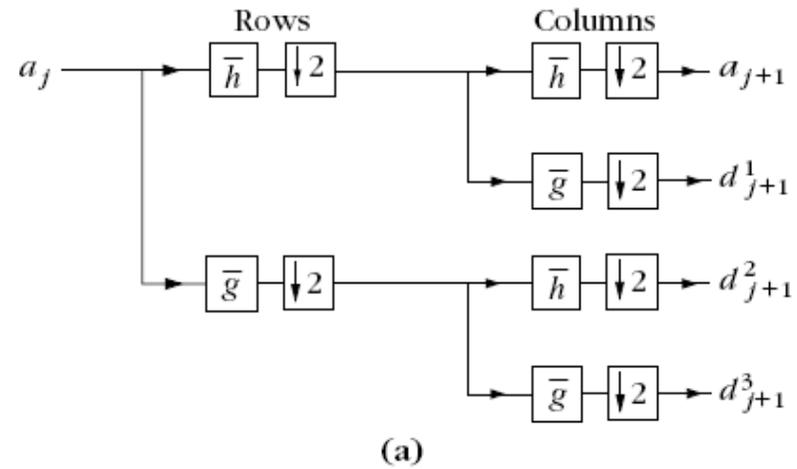

$$d_{j+1}^2[n, m] = a_j * \bar{g}\bar{h}[2n, 2m]$$

$$d_{j+1}^3[n, m] = a_j * \bar{g}\bar{g}[2n, 2m]$$

Synthesis

$$a_j[n, m] = \check{a}_{j+1} * hh[n, m] + \check{d}_{j+1}^1 * hg[n, m] + \check{d}_{j+1}^2 * gh[n, m] + \check{d}_{j+1}^3 * gg[n, m]$$

# Fast 2D DWT

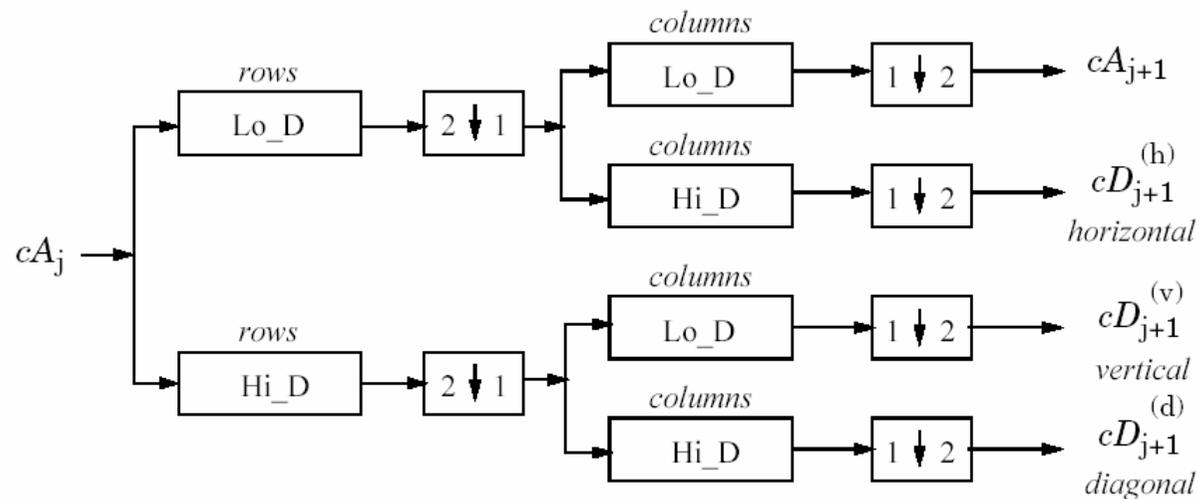

# Finite images and complexity

- When  $a_L$  is a finite image of  $N=N_1 \times N_2$  pixels, we face boundary problems when computing the convolutions
  - A suitable processing at boundaries must be chosen
- For square images with  $N_1=N_2$ , the resulting images  $a_j$  and  $d_k^j$  have  $2^j N$  samples. Thus, the images of the wavelet representation include a total of  $N$  samples.
  - If  $h$  and  $g$  have size  $K$ , one can verify that  $2K^2 \cdot 2^{j-1}$  multiplications and additions are needed to compute the four convolutions
  - Thus, the wavelet representation is calculated with fewer than  $\frac{8}{3} KN$  operations.
  - The reconstruction of  $a_L$  by factoring the reconstruction equation requires the same number of operations.

# Matlab notations

## Decomposition Step

where  $\begin{matrix} \boxed{2 \downarrow 1} \end{matrix}$  Downsample columns: keep the even indexed columns.

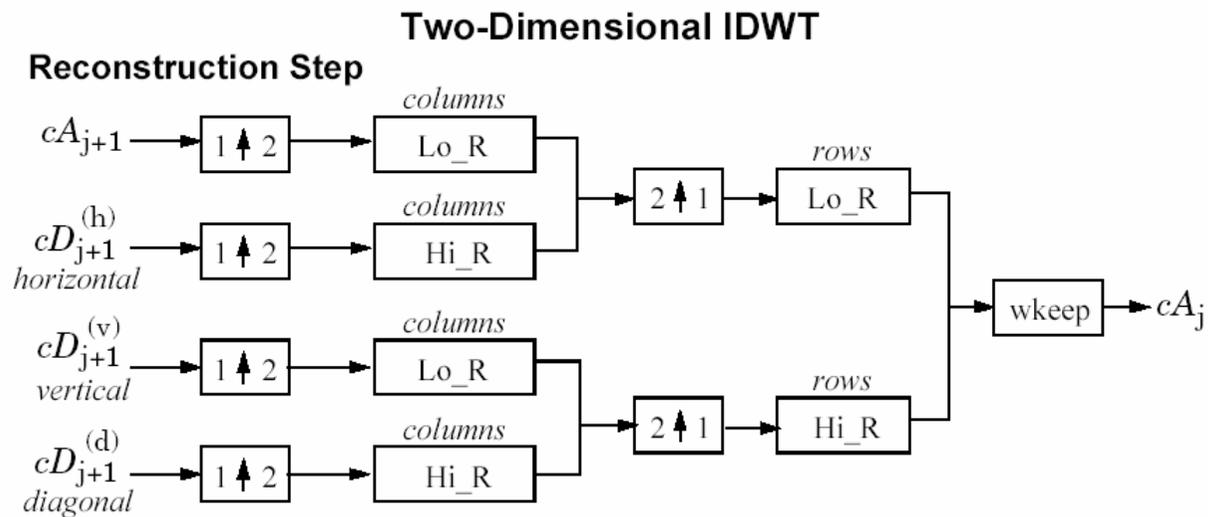

$\begin{matrix} \boxed{1 \downarrow 2} \end{matrix}$  Downsample rows: keep the even indexed rows.

$\begin{matrix} \text{rows} \\ \boxed{X} \end{matrix}$  Convolve with filter X the rows of the entry.

$\begin{matrix} \text{columns} \\ \boxed{X} \end{matrix}$  Convolve with filter X the columns of the entry.

**Initialization**  $CA_0 = s$  for the decomposition initialization.

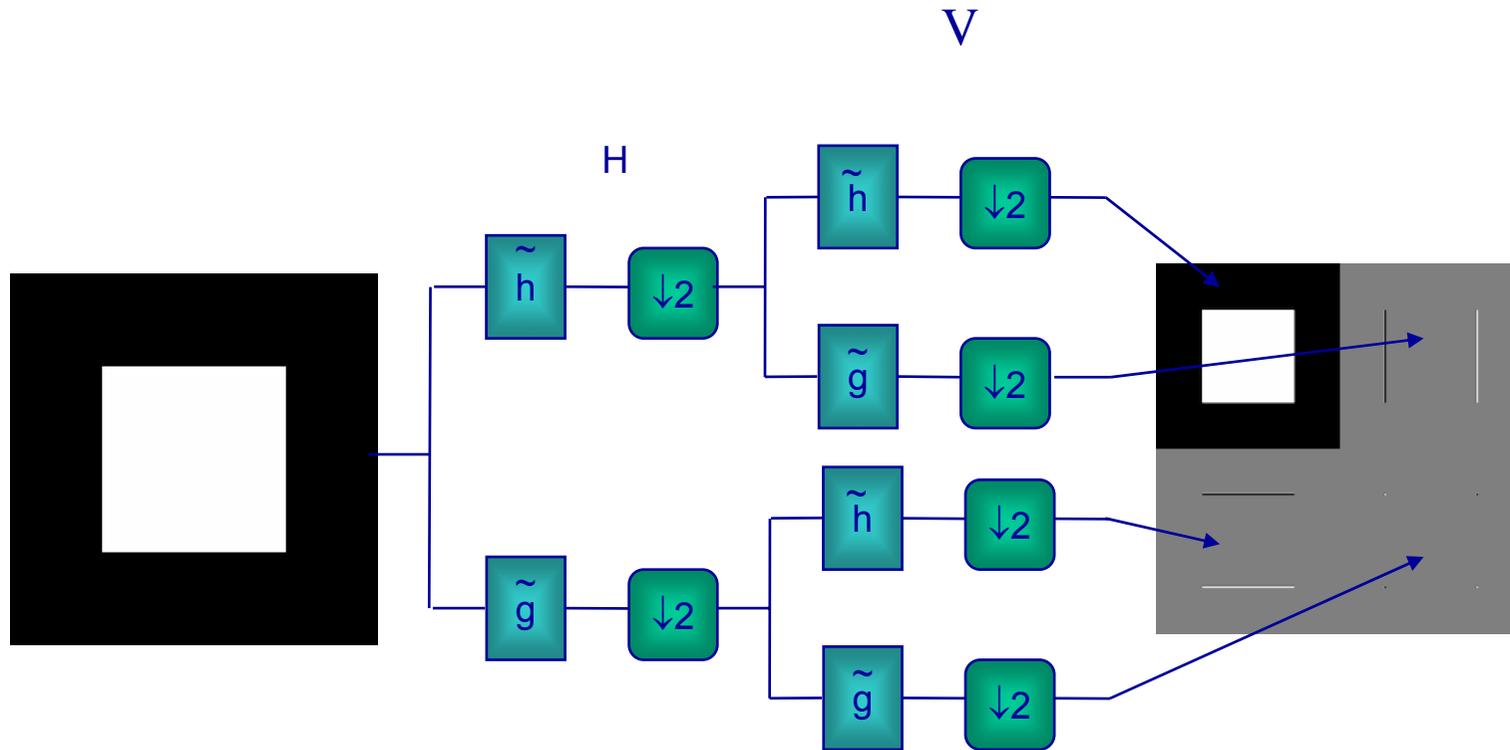

# Matlab notations
